

WHAT IS CLAIMED IS:

1. A method for contending for access to a communications medium to transmit a message of a first traffic category in a system implementing a plurality of backoff counters using a single hardware backoff counter comprising:

(1) determining if the hardware backoff counter is idle;

(2) initiating a backoff procedure for the message if the hardware backoff counter is idle;

(3) if the hardware backoff counter is busy, then:

generating a backoff time for the first traffic category;

comparing the backoff time for the first traffic category with a backoff time for a second traffic category in the hardware backoff counter; and

determining a backoff procedure based on the results of the comparison.

2. The method of claim 1, wherein each traffic category has a backoff counter, and wherein the method further comprising:

(4) if the communications medium is busy, then

updating the values in each virtual backoff counter;

selecting a message from a traffic category with a smallest
backoff counter;

initiating a backoff procedure based on the selected the traffic
category with the smallest backoff counter.

5

3. The method of claim 2, further comprising the step of (5) repeating
steps (1)-(4).

4. The method of claim 2, wherein the updating step occurs when the
10 communications medium is busy.

5. The method of claim 1, wherein the second determining step
comprising:

if the backoff time for the first traffic category is greater than the
15 backoff time in the hardware backoff timer, then:

waiting until the hardware backoff counter expires; and
initiating a new first backoff procedure for the first traffic
category;

if the backoff time for the first traffic category is equal to the backoff
20 time in the hardware backoff timer, then:

waiting until the hardware backoff counter expires; and

initiating an enhanced distributed coordinating function (EDCF)
collision procedure;

if the backoff time for the first traffic category is less than the backoff
time in the hardware backoff timer, then:

- 5 saving the contents of the hardware backoff counter; and
 initiating a new second backoff procedure for the first traffic
category.

6. The method of claim 5, wherein the step of initiating the new first
10 backoff procedure for the first traffic category comprising:

 determining a backoff time for the first traffic category;
 loading the backoff time into the hardware backoff counter; and
 starting the hardware backoff counter.

- 15 7. The method of claim 6, wherein the backoff time is equal to the
generated backoff time for the first traffic category minus the waiting time for
the hardware backoff counter to expire while second traffic category
occupies the hardware backoff counter.

- 20 8. The method of claim 5, wherein the step of initiating the new first
backoff procedure for the first traffic category comprising:

determining a contention window size for the first traffic category;
loading the contention window size into the hardware backoff
counter; and
starting the hardware backoff counter.

5

9. The method of claim 8, wherein the contention window size is equal
to the generated backoff time for the first traffic category minus the waiting
time for the hardware backoff counter to expire while second traffic category
occupies the hardware backoff counter.

10

10. The method of claim 5, wherein the EDCF collision procedure
comprising:

selecting a traffic category of higher priority from the group
comprising the first and the second traffic categories;

15

allowing the selected traffic category to transmit; and
generating a new backoff procedure for the unselected traffic
category with a contention window doubled in size.

11. The method of claim 5, wherein the step of initiating the new second
backoff procedure for the first traffic category comprising:
determining a backoff time for the first traffic category;

20

loading the backoff time into the hardware backoff counter; and
starting the hardware backoff counter.

12. The method of claim 11, wherein the backoff time is equal to
5 generated backoff time for the first traffic category.

13. The method of claim 5, wherein the step of initiating the new first
backoff procedure for the first traffic category comprising:
determining a contention window size for the first traffic category;
10 loading the contention window size into the hardware backoff
counter; and
starting the hardware backoff counter.

14. The method of claim 13, wherein the contention window size is equal
15 the backoff time for the second traffic category.

15. The method of claim 5 further comprising the step of selecting a next
traffic category to occupy the hardware backoff counter.

20 16. The method of claim 15, wherein a backoff counter value is stored for
each traffic category, and the selecting step comprising:

selecting the traffic category with the backoff counter value that is
smallest; and

initiating a backoff procedure for the selected traffic category.

5 17. The method of claim 16, wherein the step of initiating the backoff
procedure comprises loading the hardware counter with a backoff time that
is equal to the backoff counter value that is second smallest in size.

10 18. The method of claim 16, wherein the step of initiating the backoff
procedure comprises loading the hardware backoff counter with a
contention window of size equal to the backoff counter value that is second
smallest in size.

15 19. The method of claim 18, wherein if the selected traffic category is the
only traffic category with a non-zero backoff counter value, then the
hardware backoff counter is loaded with contention window of size equal to
the backoff counter value of the selected traffic category.

20 20. The method of claim 5, wherein the step of saving the contents of the
hardware backoff counter comprises saving the backoff timer and the

message to a backoff timer for the traffic category corresponding to the message in the hardware backoff timer.

21. The method of claim 5, wherein the backoff times for each traffic
5 category include the arbitration interframe space (AIFS) time associated with each traffic category.

22. A method for implementing a plurality of backoff counters using a single hardware backoff counter comprising:

determining a state of the hardware backoff counter;

if the hardware backoff counter is performing a backoff procedure,

5 then:

determining a state of a communications medium;

if the communications medium is idle, then

decrementing a value in the hardware backoff counter;

if the value is equal to zero, then allow transmission to

10 occur;

if the communications medium is busy, then

updating a value in each backoff counter;

selecting a backoff counter with a smallest value;

moving the selected backoff counter to the hardware

15 backoff counter; and

initiating a new backoff procedure with the hardware backoff counter.

23. The method of claim 22, wherein the decrementing step comprises
20 decrementing the value in the hardware backoff counter only if the communications medium has been idle a period of time at least equal to an

arbitration interframe space (AIFS) and the communications medium has been idle for a network cycle since the last time it was decremented.

24. The method of claim 23, wherein there are a plurality of traffic
5 categories, and wherein each traffic category may have a different value for the AIFS.

25. The method of claim 22, further comprising the step of repeating until
10 stopped.

26. The method of claim 22, wherein the updating step comprises:
determining a period of time between a start of the backoff procedure
currently in the hardware backoff counter and a current time; and
15 subtracting the period of time from each backoff counter.

27. The method of claim 26, wherein the backoff counter is set to zero if
the subtraction produces a result that is negative.

28. The method of claim 22, wherein there are a plurality of traffic
20 categories and each traffic category has a backoff counter, and wherein the moving step comprises:

moving a backoff counter value and a message from the hardware
backoff counter to a backoff counter for the traffic category of the message
in the hardware backoff counter; and

moving a backoff counter value and a message from the selected
5 backoff counter to the hardware backoff counter.

29. The method of claim 28, wherein if the selected backoff counter is
the hardware backoff counter, then the moving step does not actually move
any counter values and messages.

10

30.B5. The method of claim 22, wherein the selecting step selects the
backoff counter with the smallest backoff counter from all backoff counters,
including the hardware backoff counter.

15

31. The method of claim 22, wherein the initiating step comprises:
determining a backoff time; and
starting the backoff timer.

32. The method of claim 31, wherein the backoff time is equal to the
20 backoff timer value plus an arbitration interframe space of the selected
backoff timer.

33. The method of claim 31, wherein the backoff time is specified by a contention window of a size equal to the backoff timer value of a traffic category with a second smallest backoff timer value plus an arbitration
5 interframe space of the selected backoff timer.

34. The method of claim 33, wherein the contention window is provided to the hardware backoff timer and the hardware backoff timer randomly selects a backoff time from within an interval specified by the contention
10 window.

35. A circuit for implementing a plurality of backoff counters on a hardware backoff counter comprising:

a hardware backoff counter containing circuitry to decrement a backoff time once for each idle network cycle;

5 a memory coupled to the hardware backoff counter, the memory containing storage locations that contain a virtual backoff counter, an arbitration interframe space, and a information queue for each backoff counter; and

a processor coupled to the hardware backoff counter and the
10 memory, the processor containing circuitry to implement a plurality of backoff counters on a hardware backoff counter, the processor comprising:

an initial transmit hardware enqueue unit coupled to the hardware backoff counter, the initial transmit hardware enqueue unit containing circuitry to forward a transmission request to the hardware
15 backoff counter depending on the status of the hardware backoff counter;

a generate new virtual backoff unit coupled to the initial transmit hardware enqueue unit and the memory, the generate new virtual backoff unit containing circuitry to generate virtual backoff times and to place the transmission request forwarded to it by the initial transmit
20 hardware enqueue unit onto a queue;

an adjust virtual backoff counters unit coupled to the memory and the hardware backoff counter, the adjust virtual backoff counters unit containing circuitry to adjust the backoff times in the virtual backoff counters; and

5 a select and enqueue transmit frame unit coupled to the coupled to the memory and the hardware backoff counter, the select and enqueue frame unit containing circuitry to select a transmission request with the lowest backoff time and to place it in the hardware backoff counter.

10 36. The circuit of claim 35, wherein the hardware backoff counter permits direct writes to its backoff counter.

37. The circuit of claim 35, wherein the hardware backoff counter permits specification of a contention window size.

15

38. A network station comprising a circuit for implementing a plurality of backoff counters on a hardware backoff counter, the circuit comprising:
 - a hardware backoff counter containing circuitry to decrement a backoff time once for each idle network cycle;
 - 5 a memory coupled to the hardware backoff counter, the memory containing storage locations that contain a virtual backoff counter, an arbitration interframe space, and a information queue for each backoff counter; and
 - a processor coupled to the hardware backoff counter and the10 memory, the processor containing circuitry to implement a plurality of backoff counters on a hardware backoff counter, the processor comprising:
 - an initial transmit hardware enqueue unit coupled to the hardware backoff counter, the initial transmit hardware enqueue unit containing circuitry to forward a transmission request to the hardware15 backoff counter depending on the status of the hardware backoff counter;
 - a generate new virtual backoff unit coupled to the initital transmit hardware enqueue unit and the memory, the generate new virtual backoff unit containing circuitry to generate virtual backoff times and to place the transmission request forwarded to it by the initial transmit20 hardware enqueue unit onto a queue;

an adjust virtual backoff counters unit coupled to the memory
and the hardware backoff counter, the adjust virtual backoff counters unit
containing circuitry to adjust the backoff times in the virtual backoff counters;
and

5 a select and enqueue transmit frame unit coupled to the
coupled to the memory and the hardware backoff counter, the select and
enqueue frame unit containing circuitry to select a transmission request with
the lowest backoff time and to place it in the hardware backoff counter.

10 39. The network station of claim 38, wherein the network station is part of
a wireless communications network.

40. The network station of claim 38, wherein the network station is part of
a hybrid wireless and wired communications network.

15
